

What issues and problems did you notice with some of the previous websites?

Some of the websites had very little to no CSS, there weren't any menus that let me quickly direct me to what part of the website I wanted to go to. Some of the websites didn't have the required information for the course and the tables were very hard to read. It was hard telling where I am in some of the websites, I can't differentiate one section from another. It's hard to differentiate the title and its contents in some of its websites. The contents of some of the websites are too cluttered and aren't spread out enough.

How did you address these issues in your redesigned course website?

We used CSS in our website, included a menu to navigate through the contents of the page. Made separate tables to make it less confusing. Made the design minimalistic to prevent cluttering. Included all the information required for the CSCB20 website, including links to discussion boards, assignments, lectures and labs.

What are some challenges that you and your team members faced? How did you go about addressing these challenges?

Learning HTML and CSS styles was difficult at first, addressed it by looking up examples online and going on W3Schools. Making the site appealing while also not cluttered was also a challenge, addressing it by looking at examples and trial and error. We did not know what the links should link to, but we fixed that by inspecting the element of the website we're basing it off of and using those links for assignments, lectures etc.
